General Introduction

→ d-block elements : 3rd Group - 12th Group

- d-orbitals are progressively filled in each of the four long periods.
- filled from 4th period
- Transition elements
Metals.

FAQ ↗ Transition elements : The one which has incompletely filled d-orbitals in its ground state or in any of its oxidation states.

GROUP 12

Zn } not typical transition elements because they have
 Cd } full d^{10} configuration in their G.S. as well as in
 Hg } their common oxdⁿ state.

However, being the last members of three transition series, their chemistry is studied along with the chemistry of transition metals.

→ f-block elements.

- are those in which the 4f and 5f orbitals are progressively filled
- placed below the table in two long periods
- formal members of Group 3 but taken out.
- Inner transition metals
- Lanthanoids and Actinoids.

The Transition Elements (d-block)

The very name 'transition' given to the elements of d-block is only because of their position b/w s- and p-block elements.

Electronic Configurations of the d-block elements

General E.C. is

for 3d series : $3d^{1-10} 4s^{1-2}$ Anomalous configuration

$${}_{24}^{*}\text{Cr} = [\text{Ar}]^{18} 3d^5 4s^1$$

for 4d series : $4d^{1-10} 5s^{0-2}$

$${}_{29}^{*}\text{Cu} = [\text{Ar}]^{18} 3d^{10} 4s^1$$

for 5d series : $5d^{1-10} 6s^{1-2}$

for 6d series : $6d^{1-10} 7s^{1-2}$

Outer E.C. of the Transition Elements (Ground State)

1st Series (3d) : ${}_{21}^{\text{Sc}}$ to ${}_{30}^{\text{Zn}}$

${}_{21}^{\text{Sc}}$ $3d^1 4s^2$	${}_{22}^{\text{Ti}}$ $3d^2 4s^2$	${}_{23}^{\text{V}}$ $3d^3 4s^2$	${}_{24}^{\text{Cr}}$ $3d^5 4s^1$	${}_{25}^{\text{Mn}}$ $3d^5 4s^2$	${}_{26}^{\text{Fe}}$ $3d^6 4s^2$	${}_{27}^{\text{Co}}$ $3d^7 4s^2$	${}_{28}^{\text{Ni}}$ $3d^8 4s^2$	${}_{29}^{\text{Cu}}$ $3d^{10} 4s^1$	${}_{30}^{\text{Zn}}$ $3d^{10} 4s^2$
--------------------------------------	--------------------------------------	-------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	---	---

2nd Series (4d) : ${}_{39}^{\text{Y}}$ to ${}_{48}^{\text{Cd}}$

${}_{39}^{\text{Y}}$ $4d^1 5s^2$	${}_{40}^{\text{Zr}}$ $4d^2 5s^2$	${}_{41}^{\text{Nb}}$ $4d^4 5s^1$	${}_{42}^{\text{Mo}}$ $4d^5 5s^1$	${}_{43}^{\text{Tc}}$ $4d^6 5s^1$	${}_{44}^{\text{Ru}}$ $4d^7 5s^1$	${}_{45}^{\text{Rh}}$ $4d^8 5s^1$	${}_{46}^{\text{Pd}}$ $4d^{10} 5s^0$	${}_{47}^{\text{Ag}}$ $4d^{10} 5s^1$	${}_{48}^{\text{Cd}}$ $4d^{10} 5s^2$
-------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	---	---	---

f-block (58-71)

3rd Series (5d) : ${}_{57}^{\text{La}}$ to ${}_{80}^{\text{Hg}}$

${}_{57}^{\text{La}}$ $5d^1 6s^2$	${}_{72}^{\text{Hf}}$ $5d^2 6s^2$	${}_{73}^{\text{Ta}}$ $5d^3 6s^2$	${}_{74}^{\text{W}}$ $5d^4 6s^2$	${}_{75}^{\text{Re}}$ $5d^5 6s^2$	${}_{76}^{\text{Os}}$ $5d^6 6s^2$	${}_{77}^{\text{Ir}}$ $5d^7 6s^2$	${}_{78}^{\text{Pt}}$ $5d^9 6s^1$	${}_{79}^{\text{Au}}$ $5d^{10} 6s^1$	${}_{80}^{\text{Hg}}$ $5d^{10} 6s^2$
--------------------------------------	--------------------------------------	--------------------------------------	-------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	--------------------------------------	---	---

f-block (90-103)

4th Series (6d) : ${}_{89}^{\text{Ac}}$ to ${}_{112}^{\text{Cn}}$

${}_{89}^{\text{Ac}}$ $6d^1 7s^2$	${}_{104}^{\text{Rf}}$ $6d^2 7s^2$	${}_{105}^{\text{Db}}$ $6d^3 7s^2$	${}_{106}^{\text{Sg}}$ $6d^4 7s^2$	${}_{107}^{\text{Bh}}$ $6d^5 7s^2$	${}_{108}^{\text{Hs}}$ $6d^6 7s^2$	${}_{109}^{\text{Mt}}$ $6d^7 7s^2$	${}_{110}^{\text{Ds}}$ $6d^8 7s^2$	${}_{111}^{\text{Rg}}$ $6d^{10} 7s^1$	${}_{112}^{\text{Cn}}$ $6d^{10} 7s^2$
--------------------------------------	---------------------------------------	---------------------------------------	---------------------------------------	---------------------------------------	---------------------------------------	---------------------------------------	---------------------------------------	--	--

Q1: Explain why Zinc is not regarded as a transition element?

Ans: Zinc in its ground state and common oxidation state

of +2 has completely filled d-orbitals. Hence, it is considered as non-transition element.

TRY : INTEXT 8.1 ; Example 8.1 ; Back Exercise 8.1 (i to iv)
YOURSELF (FROM NCERT)

General Properties of the Transition Elements (d-Block)

1. Physical Properties :

- All are metals
- Malleable & ductile (except mercury → liquid)
- High thermal & electrical conductivity
- Metallic lustre & sonorous.

2. Atomic Radius :

- s-block > d-block > p-block (for a period)
- In a transition series, as atomic no. ↑, the atomic radii first ↓es: upto middle, becomes constant & then ↑es towards end of the period.

e.g. from Sc to Cr : atomic radii ↓ (inc. in nuclear charge)

from Cr to Cu : almost constant
(Shielding effect of d-e's neutralise the nuclear charge)

from Cu to Zn : size ↑es
Zn has higher atomic radius

${}_{30}^{Zn}$: $3d^{10} 4s^2$

[1111111111] inter e⁻ repulsion

↓ expansion of e⁻ cloud

V. Imp

•) $3d \rightarrow 4d \rightarrow 5d$: size ↑es due to introduction of new principal shell.

Note: The size of 4d elements is almost the same size of the 5d series elements.

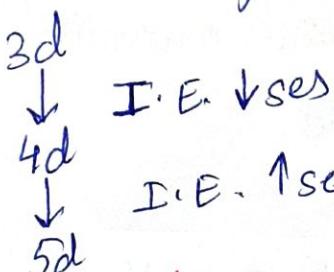

This is due to filling of 4f before 5d orbitals which results in regular decrease in atomic radii & called as **Lanthanoid Contraction**. e.g. (Zr 160pm, Hf 159pm)

3. Ionic Radii: Use with \uparrow se in oxidation state.

4. Ionisation Enthalpy:

- from left to right along the series, I.E. \uparrow se. (However, irregular trend in the 1st I.E. of 3d metals is due to irregularity in E.C. of 4s and 3d orbitals).

In a group,

I.E. ↓ses

I.E. ↑ses

(Lanthanoid Contraction)
↳ poor screening of 4f orbital e⁻s

Hg: highest I.E. (1007 kJ/mol)

La: lowest I.E. (540 kJ/mol)

5. Oxidation State: d-block elements show variable O.S. due to similar energies of n_s and (n-1)d electrons (except 1st & last member)

Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn
+2	+2	+2	+2	+2	+2	+2	+2	+1	+2
+3	+3	+3	+3	+3	+3	+3	+3	+2	
	+4	+4	+4	+4	+4	+4	+4		
	+5	+5	+5	+5					
	+6	+6	+6	+6					
			+7						

Q2. Name the transition element which does not exhibit variable oxdⁿ state.

Ans: Sc ($Z=21$)

Q3. Calculate the oxidation state of Fe in $\text{Fe}(\text{CO})_5$ and

Ni in $\text{Ni}^{\circ}(\text{CO})_4$.

Ans³ Zero

Q⁴: Name any two transition metals which exhibit oxdⁿ state of +8.

Ans⁴: Ru and Os exhibit +8 Oxidⁿ state.

TRY YOURSELF : INTEXT (8.3) ; BACK EXERCISE (8.2, 8.5, 8.9, 8.13)
(FROM NCERT)

6. Trends in the M^{2+}/M Standard Electrode Potentials:

E°/V	Ti	V	Cr	Mn	Fe	Co	Ni [°]	Cu	Zn
(M^{2+}/M)									
	-1.63	-1.18	-0.90	-1.18	-0.44	-0.28	-0.25	0.34	-0.76

* $E^{\circ}(M^{2+}/M)$ values: irregular due to irregular variation of I.E ($\Delta_i H_1 + \Delta_{i+1} H_2$) and also sublimation enthalpies which are relatively much less for Mn & V.

* Cu: positive E°

High energy to transform Cu(s) to $\text{Cu}^{2+}(\text{aq})$ is not balanced by its hydration energy.

Q⁵: Why is Cr^{2+} reducing and Mn^{3+} oxidising when both have d^4 configuration?

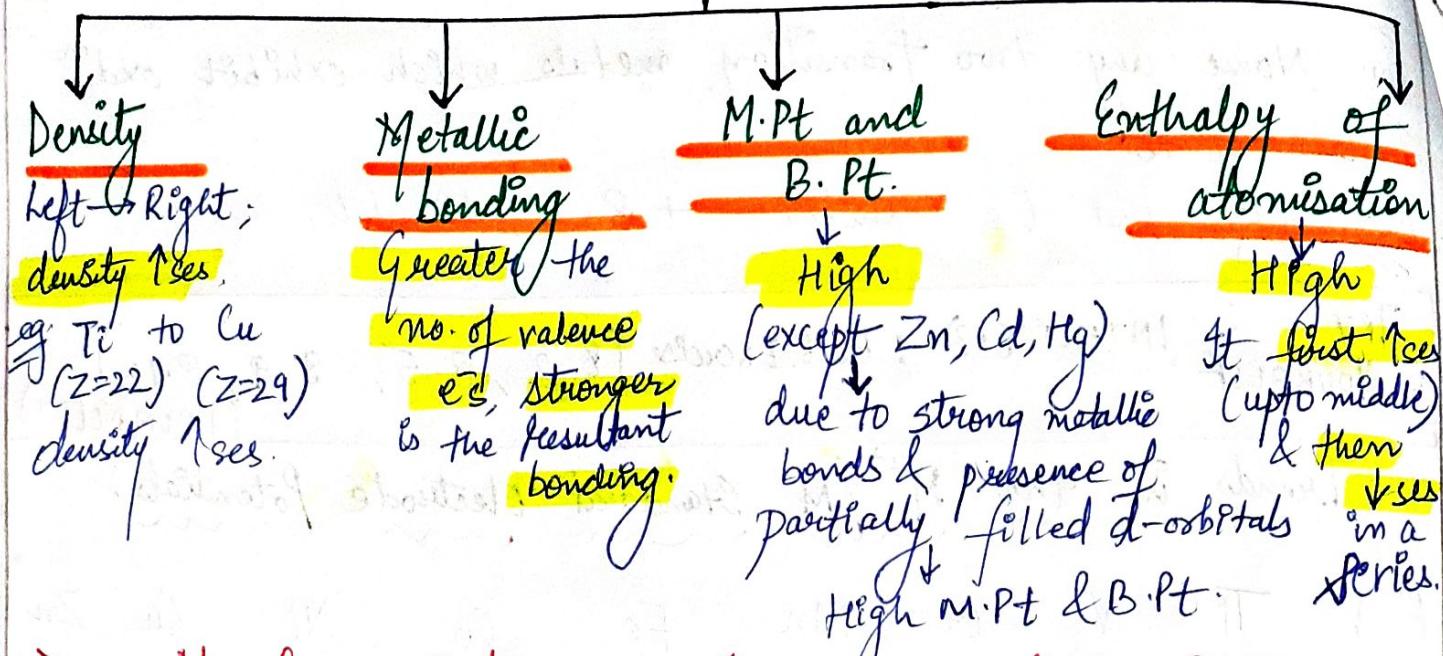

Ans⁵: Cr^{2+} is reducing as its configⁿ changes from $d^4 \rightarrow d^3$
 d^3 : half filled t_{2g} level

$\text{Mn}^{3+} \rightarrow \text{Mn}^{2+}$: half-filled d^5 configⁿ: Extra stability.
↓
oxidising
L → (gains e⁻)

FAQ

TRANSITION ELEMENTS

→ No. of unpaired e⁻s \propto Enthalpy of Atomisation

Magnetic Properties

By MAGNET

- Diamagnetic : no unpaired e⁻ (repelled)
- Paramagnetic : one/more unpaired e⁻ (weakly attracted)
- Ferromagnetic : (strongly attracted)

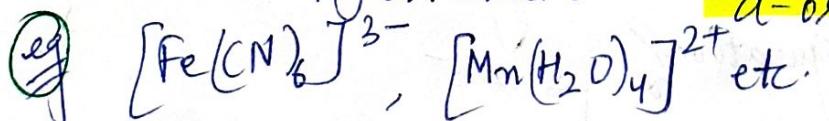

$$\mu_s = \sqrt{n(n+2)} B.M.$$

(Magnetic moment)

TRANSITION ELEMENTS

Complex formation

(due to high charge & availability of on Transition metal d-orbitals)

Catalytic Properties

(due to their ability to adopt multiple oxidation states & ability to form complexes)

e.g. Fe : Haber Process

V_2O_5 : Contact Process ($SO_2 \rightarrow SO_3$)

$PdCl_2$: Wacker Process etc.

FAQ

formation of Coloured Ions

Colour: due to unpaired e^- s \rightarrow excitation

d^0 & d^{10} : Colourless
(no e^- s) (all e^- s are paired up)

(d-d transition)

Alloy formation

(due to almost similar size of metal ions ($\sim 15\%$)
high ionic charges & availability of d-orbitals)

(eg) Steel, Brass, Stainless steel etc.

formation of Interstitial Compounds

(small-sized atoms of H, B, C, N etc. can easily occupy positions in the voids present in the crystal lattices of transition metals.)

→ usually non-stoichiometric & are neither ionic nor covalent. (eg) TiC, Mn_3N , $VMo_{0.56}$ etc.

Characteristics of interstitial compounds

- ① High M.P.T (higher than those of pure metals)
- ② Very hard
- ③ They retain metallic conductivity
- ④ Chemically inert.

Trends in the M^{3+}/M^{2+} Standard Electrode Potentials:

$E^\circ_{M^{3+}/M^{2+}}$ (in V)	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn
-	-0.37	-0.26	-0.41	+1.57	+0.77	+1.97	-	-	-	-

$E^\circ(M^{3+}/M^{2+})$ values show varying trend.

- Low value for Sc : shows Sc in +3 \rightarrow noble gas E.C.
- Highest value for Zn : due to removal of an e⁻ from stable d¹⁰ configⁿ of Zn²⁺.
- High values for Mn : shows that Mn²⁺ (d⁵) : more stable

8. Trends in Stability of higher Oxidation States:

Oxd ⁿ No.						
+6			CrF ₆			
+5		VF ₅	CrF ₅			
+4	T ^{IV} X ₄	VX ₄ ⁺	CrX ₄	MnF ₄		
+3	T ^{III} X ₃	VX ₃	CrX ₃	MnF ₃	FeX ₃ ¹	CoF ₃
+2	T ^{II} X ₂ ¹¹	VX ₂	CrX ₂	MnX ₂	FeX ₂	CoX ₂
+1					CoX ₂	NiX ₂
					CuX ₂	ZnX ₂
						CuX ¹¹

Key: X = F \rightarrow I ; X¹ = F \rightarrow Br ; X¹¹ = F, Cl ; X¹¹¹ = Cl \rightarrow I

Table 1 : Formulae of halides of 3d Metals

→ The ability of fluorine to stabilise the highest oxidation state is due to either higher lattice energy (as in case of CoF₃) or higher bond enthalpy (due to the higher covalent compounds (e.g. VF₅ and CrF₆))

→ Another feature of fluorides is their instability in the low oxidation states (e.g. V²⁺ ; X = Cl, Br, or I) and the same applies to Cu²⁺.

All Cu^{II} halides are known (except the Padiode). In this case, Cu²⁺ oxidises I⁻ to I₂

However, many copper (I) compounds are unstable in aqueous solution & undergo disproportionation.

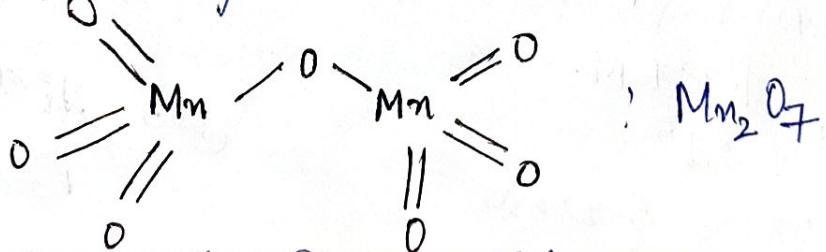

Note: The stability of Cu^{2+} (aq.) rather than Cu^+ (aq.) is due to the much more -ve $\Delta H_{\text{hyd}}^\ominus$ of Cu^{2+} (aq.) than Cu^+ , which more than compensates the second I.E. of Cu.

Table 2: Oxides of 3d metals

Oxid ⁿ No.	3	4	5	GROUPS	6	7	8	9	10	11	12
+7											
+6											
+5					V_2O_5						
+4		TiO_2	V_2O_4		CrO_2	MnO_2					
+3	Sc_2O_3	Ti_2O_3	V_2O_3		Cr_2O_3	Mn_2O_3	Fe_2O_3				
+2			TiO	VO	(CrO)	MnO	Fe_3O_4^*	Co_3O_4^*			
+1						FeO	CoO	NiO	CuO	ZnO	
											Cu_2O

* mixed oxides

- The highest oxidation no. in the oxides coincides with the group no. and is attained in Sc_2O_3 to Mn_2O_7 .
- The ability of oxygen to stabilise these high O.S. > fluorine. Thus; Highest fluoride of Mn is $\underline{\underline{\text{MnF}_4}}$ but oxide is $\underline{\underline{\text{Mn}_2\text{O}_7}}$.

The ability of oxygen to form multiple bonds to metals explains its superiority.

Q6: MnF_7 is not stable while Mn_2O_7 is stable. Why?
→ because of overcrowding of F.

9. Chemical Reactivity and E° Values:

Transition metals vary widely in their chemical reactivity.

→ Metals of 1st series (3d) are relatively more reactive (except Cu) & are oxidised by 1M H⁺.

Note: Ti & V: passive to dilute non-oxidising acids at room temp.

→ E° values for M²⁺/M: indicate a ↓ing tendency to form divalent cations across the series. This is related to the ↑se in sum of 1st & 2nd I.E.

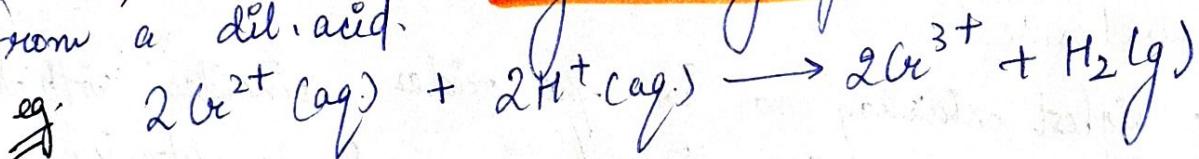

→ E° values for Mn²⁺/Mn, Ni²⁺/Ni and Zn²⁺/Zn are more -ve than expected.

(d⁵) Mn²⁺ & Zn²⁺ (d¹⁰): due to half-filled & full filled E.C.

Ni²⁺: E° value is related to highest -ve $\Delta H_{\text{hydration}}$.

★ Mn³⁺ & Co³⁺: strong oxidising agents in aq. soln.

★ Ti²⁺, V²⁺ & Cr²⁺: strong reducing agents & liberate H₂ from a dil. acid.

Q7 Calculate spin only magnetic moment of given ions:

(i) $_{29}\text{Cu}^{2+}$: 3d⁹ 

$$\mu_s = \sqrt{n(n+2)} = \sqrt{1(1+2)} = \sqrt{3} = 1.73 \text{ B.M.}$$

(iii) $_{26}\text{Fe}^{3+}$: 3d⁵
 $\sqrt{5 \times 7} = 5.92 \text{ B.M.}$

(ii) $_{24}\text{Cr}^{2+}$: 3d⁴ 

$$\mu_s = \sqrt{4 \times 6} = \sqrt{24} = 4.90 \text{ B.M.}$$

(iv) $_{28}\text{Ni}^{2+}$: 3d⁸
 $\sqrt{2 \times 4} = 2.84 \text{ B.M.}$

TRY YOURSELF! INTEXT (8.2, 8.4, 8.5, 8.8, 8.9); EXAMPLE (8.5), (8.9); BACK EXERCISE (8.11, 8.12, 8.18, 8.21, 8.22, 8.24) (FROM NCERT)

The Inner Transition Elements (f-block)

- The elements in which filling of electrons takes place in $(n-2)f$ -subshell which belongs to anti-penultimate (third to the outermost) energy shell.
- The f-block consists of two series of elements known as Lanthanoids and Actinoids.

The general electronic configuration of the f-block elements is $(m-2)f^{1-14} (m-1)d^{0-1} ms^2$

for Lanthanoids, m is 6 while its value is 7 for Actinoids. There are many exceptions in the electronic configuration.

LANTHANOIDS: The series involving the filling of 4f-orbitals following Lanthanum ($Z=57$) is called the lanthanoid series. There are 14 elements in this series starting with Ce ($Z=58$) to Lu ($Z=71$).

• Electronic Configuration: $[Xe] 4f^{1-14} 5d^{0-1} 6s^2$

Atomic No.	Name	Symbol	Ln	Ln^{2+}	Ln^{3+}
57	Lanthanum	La	$5d^1 6s^2$	$5d^1$	$4f^0$
58	Cerium	Ce	$4f^1 5d^1 6s^2$	$4f^2$	$4f^1$
59	Praseodymium	Pr	$4f^3 6s^2$	$4f^3$	$4f^2$
60	Neodymium	Nd	$4f^4 6s^2$	$4f^4$	$4f^3$
61	Promethium	Pm	$4f^5 6s^2$	$4f^5$	$4f^4$
62	Samarium	Sm	$4f^6 6s^2$	$4f^6$	$4f^5$
63	Europium	Eu	$4f^7 6s^2$	$4f^7$	$4f^6$
64	Gadolinium	Gd	$4f^7 5d^1 6s^2$	$4f^7 5d^1$	$4f^7$
65	Terbium	Tb	$4f^9 6s^2$	$4f^9$	$4f^8$
66	Dysprosium	Dy	$4f^{10} 6s^2$	$4f^{10}$	$4f^9$

67	Holmium	Ho	4f ¹¹ 6s ²	4f ¹¹	4f ¹⁰
68	Erbium	Er	4f ¹² 6s ²	4f ¹²	4f ¹¹
69	Thulium	Tm	4f ¹³ 6s ²	4f ¹³	4f ¹²
70	Ytterbium	Yb	4f ¹⁴ 6s ²	4f ¹⁴	4f ¹³
71	Lutetium	Lu	4f ¹⁴ 5d ¹ 6s ²	4f ¹⁴ 5d ¹	4f ¹⁴

* Only electrons outside [Xe] core are indicated.

1. Atomic and ionic sizes: With Increasing atomic no., the atomic and ionic radii decreases from one element to the other but the decrease is very small.

A steady decrease in the size of lanthanoids with increase in atomic no. is known as Lanthanoid Contraction.

★ Consequences of Lanthanoid contraction:

- (a) It leads to similar physical & chemical properties among lanthanoids.
- (b) Zr and Hf have similar properties due to similar atomic radii.
- (c) Chemical separation of lanthanoids becomes difficult.

Properties of
Lanthanoids

- Oxidation State
 - Mainly give +3 O.S. but some elements show +2 and +4 O.S.
- Silvery white soft metals & tarnish rapidly.
- Hardness ↑ as atomic no. ↑ Samarium (Sm) being steel hard.
- Malleable, ductile, High M.Pt., good conductor of electricity; highly dense metals.
- form alloys with other metals easily. e.g. Mischmetall
- Colour
 - Many trivalent lanthanoid ions are coloured both in solid & in aq. soln.
 - (Colour → presence of f-electrons; f-f transition)

→ Magnetic Properties

- La^{3+} and Lu^{3+} : Diamagnetic
 $(4f^0)$ $(4f^{14})$
- Other trivalent Lanthanoid ions : Paramagnetic

due to presence
of unpaired e^- s

Q8. Name a member of the Lanthanoid series which is well known to exhibit +4 O.S.

Ans. Cerium ($Z = 58$)

TRY YOURSELF : Back Exercise 8.20 (i, ii, iii), 8.27, 8.31, 8.32
(FROM NCERT)

→ BOARDS ~~Ke liye~~

1. Solve NCERT Exemplar (deleted portion)

2. Some important & F.A. Questions : **MUST TRY**

Q1. What is meant by 'Lanthanoid Contraction'?

Q2. Why do transition elements show variable "oxd" states?

Q3. Give reasons :

(i) Generally, there is an increase in density of elements from Ti ($Z=22$) to Cu ($Z=29$)

(ii) Transition elements generally form coloured compounds.

(iii) Transition elements & their compounds are generally found to be good catalysts.

Q4. Assign reasons:

(i) Cr^{2+} is a strong reducing agent

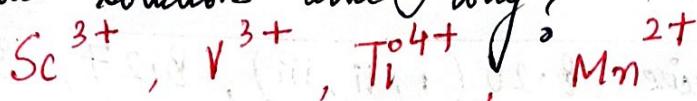

(ii) Zn^{2+} salts are colourless.

(iii) Copper (1) ion is not known to exist in aqueous solutions.

Q5. Explain the following:

- (i.) The enthalpies of atomization of transition metals are quite high.
- (ii.) Transition metals and their compounds generally exhibit a paramagnetic behaviour.

Q6. Which of the following cations are coloured in aqueous solutions and why?

Q7. Mention two main consequences of Lanthanoid contraction.

Q8. In the 3d series ($\text{Sc} = 21$ to $\text{Zn} = 30$)

- (i.) which element shows maximum no. of oxidation states?
- (ii.) which element shows only +3 O.S.?
- (iii.) which element has the lowest enthalpy of atomization?

GOOD LUCK!
